## Variation Inference Linear Regression

May 16, 2019

First import required modules

## 1 Regression Spline

Assume that the range of x is [a, b]. Let the point

$$a < \xi_1 < \cdots < \xi_K < b$$

be a partion of the interval [a, b]  $\{\xi_1, \dots, \xi_K\}$  are called knots.

Then make the function which return the knot points

## 2 Radial Basis Function

A RBF  $\varphi$  is a real valued function whose value depends only on the distance from origin. A real function  $\varphi: [0, \infty) \to \mathbb{R}$  with a metric on space  $\|\cdot\|: V \to [0, \infty)$  a function  $\varphi_c = \varphi(\|\mathbf{x} - \mathbf{c}\|)$  is said to be a radial kernel centered at c. A radial function and the associated radial kernels are said to be radial basis function

we use radial basis functions defined by

$$\mathbf{b}(u) = \left\{ u, \left| \frac{u - \tau_1}{c} \right|^3, \cdots, \left| \frac{u - \tau_K}{c} \right|^3 \right\}$$

where *c* is sample standard deviation

Then we can make the function which retrun the basis

Nonparametric linear model can be represented as

$$Y = \mathbf{b}(X)\boldsymbol{\beta} + \varepsilon$$

where  $Y \in \mathbb{R}^{n \times 1}$ ,  $X \in \mathbb{R}^{n \times 1}$  and  $\varepsilon \sim N(0, \tau^{-1})$ 

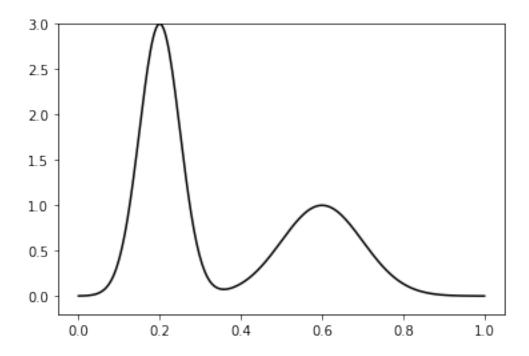

## 3 Make toy data

Let

$$y = 3 \exp(-200(x - 0.2)^2) + \exp(-50(x - 0.6)^2)$$

Plotting true distribution of *Y* is

In [4]: 
$$x = np.linspace(0,1,300)$$
  
 $y = 3*np.exp(-200*(x-0.2)**2) + np.exp(-50*(x-0.6)**2)$ 

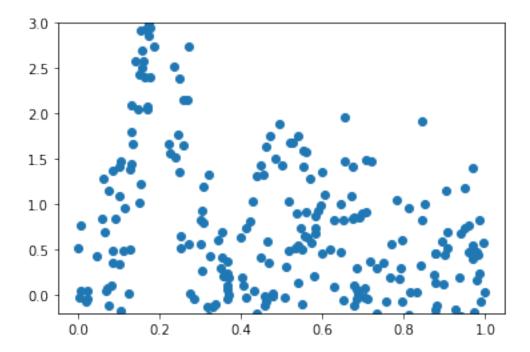

make the simulation function which make the obs with error N(0, 0.5)

Plotting the distribution of simulated data

$$y = 3 \exp(-200(x - 0.2)^2) + \exp(-50(x - 0.6)^2) + \varepsilon$$

where  $\varepsilon \sim N(0, 0.5)$ 

In 
$$[7]: x,y = mkToy()$$

Calculate the standard deviation of observed data

0.29923910225377626

Define the knot and design matrix

```
In [10]: knot = defineKnot(x)
         d_x = b(x,knot,sd).T
   plotting the fitted value
In [11]: fitted = d_x.dot(np.linalg.inv(d_x.T.dot(d_x))).dot(d_x.T).dot(y)
In [12]: plt.plot(x,fitted,'o')
         plt.ylim(-0.2, 3)
         plt.show()
          3.0
          2.5
          2.0
          1.5
          1.0
          0.5
          0.0
                           0.2
                                                  0.6
                0.0
                                       0.4
                                                              0.8
```

```
In [13]: def mfvb(X,y,max_iter):
    N,p = X.shape
    a ,b, c, d = [10**(-7)]*4

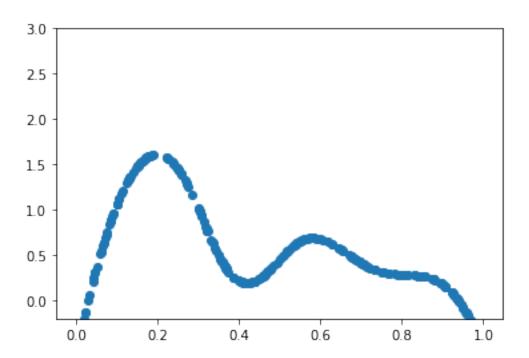

a_tilde = np.repeat(a + 0.5, p)
    b_tilde = np.repeat(b,p)
    c_tilde = c + (N+1)/2
    d_tilde = d

mu_coeffs = np.repeat(0,p)
    sigma_coeffs = np.diag(np.repeat(1,p))

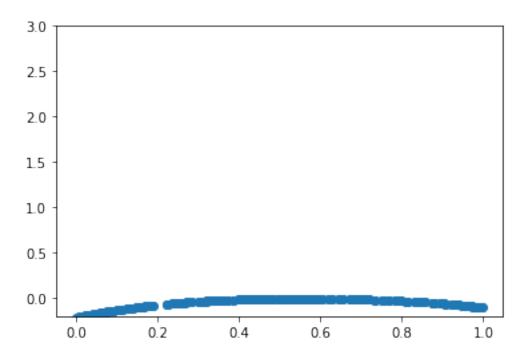

for i in range(max_iter):
    expected_coeffs = mu_coeffs
```

```
double_expected_coeffs = sigma_coeffs + mu_coeffs.dot(mu_coeffs.T)
    diagonal_sigma = np.diag(sigma_coeffs)
    expected_alpha = np.array(list(map(lambda x : a_tilde[x]/b_tilde[x] , np.arange
    log_expected_alpha = np.array(list(map(lambda x : digamma(a_tilde[x])-np.log(b_expected_tau = c_tilde / d_tilde
    log_expected_tau = digamma(c_tilde)-np.log(d_tilde)
    sigma_coeffs = np.linalg.inv(np.diag(expected_alpha)+expected_tau*(X.T.dot(X)))
    mu_coeffs = expected_tau*sigma_coeffs.dot(X.T.dot(y))
    b_tilde = np.array(list(map(lambda x : (diagonal_sigma[x]+mu_coeffs[x]**2)/2 +
    d_tilde = d+0.5*(y.T.dot(y)) - expected_coeffs.T.dot((X.T.dot(y))+ 0.5*sum(np.dot
    return mu_coeffs,sigma_coeffs
```
